**ACADEMIC YEAR: 2026-27
BCA SEM – 5**

CANDIDATE’S DECLARATION

I, **Joshi Tirth J.** declare that final year report entitled “**TrustNote**” is my own work conducted under the supervision of **Dr.Viral Dagli** the project guide of “TrustNote”.

I further declare that to the best of my knowledge the report for BCA 5th semester does not contain part of the work which has been submitted for the eligible for BCA degree either in this or any other university without proper citation.

Submitted To:

Dr. Viral Dagli

Department of Computer Science,

C. U. Shah College. Wadhwan City,

State: Gujarat.

Joshi Tirth

Branch: Computer Application

CANDIDATE’S DECLARATION

I, **Kunpara Raj P.** declare that final year report entitled “**TrustNote**” is my own work conducted under the supervision of **Dr.Viral Dagli** the project guide of “TrustNote”.

I further declare that to the best of my knowledge the report for BCA 5th semester does not contain part of the work which has been submitted for the eligible for BCA degree either in this or any other university without proper citation.

ACKNOWLEDGEMENT

As of now of time when we are composing this documentation we had an opportunity to look four months back when we were at this point to take up any project close by taking into consideration this cut of time and the status now, we unequivocally feel a feeling of distinction, a feeling of having developed. We consider our self-lucky to be served this excellent piece of information and experience for four valuable months we spent at Shree C. U. Shah College of Management & Computer Education, Wadhwan.

For this, we are very thankful to our college that provided their resources in making us competent and deserving of taking up such a difficult undertaking. For this undertaking project that needs an additional knowledge and guidance for the successful development, we say thanks to Dr.Viral Dagli, Department of B.C.A division.

ABSTRACT

TrustNote is a web-based note management system designed to provide users with a simple and organized platform for creating and managing personal notes. The system allows registered users to securely log in and perform basic note management operations such as creating, viewing, editing, and deleting their notes. This helps users maintain their important information in a centralized digital environment.

The system also provides an admin module for managing registered users. The administrator can log in to the system, view the list of registered users, and delete user accounts when required. Role-based access ensures that users can manage only their own notes, while administrative functions are restricted to the administrator.

The main objective of TrustNote is to provide an easy-to-use and efficient system for digital note management while maintaining basic user authentication and administrative control.

INTRODUCTION

1.1 PROJECT DETAILS

TrustNote is a web-based note management system designed to help users create, store, view, edit, and delete their personal notes in a simple and organized manner. The application provides an intuitive interface where users can manage their notes efficiently without the need for physical notebooks or other manual methods.

The system includes **user registration, secure login, logout, note creation, note viewing, note editing, and note deletion** features. Each user's notes are associated with their account, allowing users to manage their own personal information securely. The system also provides an **administrator module**, through which the administrator can view registered users and delete user accounts when required.

TrustNote provides a centralized platform for digital note management that reduces the time and effort required to organize personal notes.

1.2 PURPOSE

The purpose of developing **TrustNote** is to provide a simple, user-friendly, and web-based platform that enables users to create and manage their personal notes efficiently. The system allows users to store important information digitally and access their notes whenever required through a web browser.

The application provides essential features such as **user registration, secure login, logout, creating notes, viewing notes, editing notes, and deleting notes**. Each user can manage their own notes, while the administrator has separate access to view and manage registered users.

Furthermore, TrustNote aims to reduce the dependency on traditional methods of maintaining notes and provides an organized digital environment for note management. The project also serves as a practical implementation of **CRUD operations, user authentication, session management, database management, and web application development** using technologies such as PHP, MySQL, HTML, CSS, and JavaScript.

1.3 SCOPE

The **TrustNote** system is designed to provide a simple, efficient, and user-friendly platform for creating and managing personal notes through a web-based interface. The scope of the system mainly focuses on allowing registered users to securely manage their own notes.

The system allows users to register, log in, log out, create notes, view notes, edit existing notes, and delete notes that are no longer required. The notes created by a user are associated with that user's account so that users can manage their own information.

The system also provides an administrator interface for managing registered users. The administrator can log in, view the list of users, and delete user accounts when necessary. Access to administrative functions is restricted to the administrator.

The application can be accessed through a web browser and provides an organized method of managing digital notes. It demonstrates important web development concepts such as user authentication, session management, database connectivity, CRUD operations, form handling, and role-based access using technologies such as PHP, MySQL, HTML, CSS, and JavaScript.

The future scope of TrustNote includes features such as note search, categories and labels, note pinning, reminders, image and file attachments, password recovery, email verification, note sharing, rich-text formatting, two-factor authentication, cloud deployment, and improved security. These enhancements can make the system more comprehensive and suitable for real-world note management.

1.4 OBJECTIVES

The main objectives of the **ApnaGhar** project are:

1. To develop a **simple and user-friendly web-based note management system**.
2. To implement **user registration, login, and logout** functionality.
3. To allow users to **create and store personal notes** digitally.
4. To allow users to **view their existing notes** in an organized manner.
5. To provide functionality for users to **edit and update their notes** whenever required.
6. To allow users to **delete notes** that are no longer required.
7. To ensure that users can **manage their own notes** through user authentication and session management.
8. To provide an **administrator module** for viewing registered users.
9. To allow the administrator to **delete user accounts** when required.
10. To store and manage **user and note information using PHP and MySQL**.
11. To reduce the **time and effort** required to maintain personal notes manually.
12. To demonstrate important web development concepts such as CRUD operations, database management, authentication, session handling, and role-based access.

PROJECT MANAGEMENT

2.1 FEASIBILITY STUDY:

Feasibility is the measure of how beneficial and practical the development of an information system will be. The process of evaluating the feasibility of a proposed system is known as **feasibility analysis**. For the **TrustNote** project, feasibility is studied in terms of technical, operational, and economic aspects.

2.1.1 Technical Feasibility:

Technical feasibility is a measure of the practicality of a specific technical solution and the availability of technical resources and expertise. The analyst must determine whether the available hardware, software, and technologies are capable of handling the requirements of the **TrustNote** system.

The system can be developed using **HTML, CSS, JavaScript, PHP, and MySQL**, along with a standard computer, web browser, and **XAMPP/Apache server**. These technologies are widely available and require relatively low system resources. Since the required hardware, software, and development tools are easily available, the proposed **TrustNote** system is technically feasible.

2.1.2 Operational Feasibility:

Operational feasibility measures how effectively the proposed solution will work for its intended users. **TrustNote** is designed with a simple and user-friendly interface that allows users to register, log in, create notes, view notes, edit notes, delete notes, and log out of the system.

The administrator has a separate module through which the administrator can log in, view registered users, and delete user accounts when required. The system is easy to understand and does not require specialized technical knowledge from users. Therefore, **TrustNote is operationally feasible** and can help users manage their personal notes efficiently.

2.1.3 Economic Feasibility:

Economic feasibility is a measure of the cost-effectiveness of a project or solution. For declaring the system economically feasible, the benefits obtained from the project should exceed or at least be equal to the cost of development. The TrustNote project uses freely available and open-source technologies such as PHP, MySQL, HTML, CSS, JavaScript, and XAMPP, which helps reduce development expenses. The main costs are related to computer resources, internet connectivity, hosting, and development time. Since the overall development cost is low and the system provides useful benefits by offering a centralized platform for creating and managing personal notes, the TrustNote project is economically feasible.

The cost spent in the making of the project is categorized into two parts:

1) Direct cost:

- This is in terms of money.
- Hardware (Computer)
- Software (Visual Studio Code)
- System study

2) Indirect cost:

- This is in terms of employees or the manual work.
- Time spent in system analysis
- Managing time
- Referring other sources like the internet.

2.2 PROJECT PLANNING:

2.2.1 Project Development Approach & Justification:

How use this model for developing this project

- In the initiation phase, you will define the project. You will sort out the project goals, scope, and resources of the project and what roles are needed on the team. Clarifying what stakeholders expect out of the project, and what exactly the project is aiming to achieve (and why) will give the project and team clear direction.
- In the planning phase, you will determine the steps to actually achieve the project goals—the “how” of completing a project. You will establish budgets, timelines, milestones, source materials, and necessary documents. This step also involves calculating and predicting risk, establishing change processes in place, and outlining communication protocols. If the initiation phase is assembling your troops, the planning phase is deciding what to do with them.
- Executing a project means putting your plan into action and keeping the team on track. Generally, this means tracking and measuring progress, managing quality, mitigating risk, managing the budget, and using data to inform your decisions. Specific steps might include:

- Using tools like DFD and E-R or burndown charts to track progress on tasks
 - Responding to risks when they manifest
 - Recording costs
 - Keeping team members motivated and on task
 - Keeping stakeholders informed of progress
 - Incorporating changes via change requests
- In the closing phase of the project management lifecycle, you will conclude project activities, turn the finished product or service over to its new owners and assess the things that went well and did not go so well. It will also be a time to celebrate your hard work. Steps in the closing phase can include:
 - Conducting retrospectives and take notes of changes you can implement in the future.
 - Communicating to stakeholders at the end of the project and providing an impact report
 - Communicating with the new owners of a project.
 - Creating a project closeout report
 - Celebrating the end of the project and your successes

2.2 PROJECT SCHEDULING:

Scheduling in project management is the listing of activities, deliverables, and milestones within a project. A schedule usually includes a planned start and finish date,

duration, and resources assigned to each activity. Effective project scheduling is a critical component of successful time management, especially for professional service businesses.

In this guide, we will explore the concept of scheduling in project management, its importance, and how it is done. We will also look into the different scheduling techniques, tools, and best practices that project managers can leverage to keep their projects on track and deliver successful outcomes.

If you are looking for a tool that will allow you to have full control over the scheduling processes for your projects, Wrike has the right solution for you. You can start today and unlock the full power of project management.

Resources required for Development of Project:

- Human effort
- Sufficient disk space on server
- Specialized hardware
- Software technology
- Travel allowance required by project staff, etc.

Advantages of Project Scheduling:

- It simply ensures that everyone remains on same page as far as tasks get completed, dependencies, and deadlines.
- It helps in identifying issues early and concerns such as lack or unavailability of resources.
- It also helps to identify relationships and to monitor process.
- It provides effective budget management and risk mitigation.

SYSTEM REQUIREMENT STUDY

3.1 STUDY OF CURRENT SYSTEM

The current note-management system mainly relies on traditional notebooks, diaries, text files, mobile note applications, and basic document editors for creating and storing personal notes. Users often maintain their notes in different places, which can make it difficult to organize, update, and access important information efficiently.

Modern digital note-taking applications generally provide features such as user registration and login, note creation, note viewing, note editing, note deletion, and user account management. These features allow users to maintain their personal notes digitally and access them through a web or mobile interface.

Traditional methods of maintaining notes may also provide limited security and organization. Physical notebooks can be lost or damaged, while basic files may not provide proper user authentication or account-based note management. Managing a large number of notes can also become inconvenient when there is no centralized system.

Overall, the study of the current system shows that there is a need for a simple, centralized, user-friendly, and organized web-based note management system such as TrustNote. The proposed system aims to simplify note management, provide secure user access, and allow users to create, view, edit, and delete their personal notes efficiently.

3.2 PROBLEMS AND WEAKNESS OF CURRENT SYSTEM

1) Limited Organization of Notes:

In traditional note-taking systems, users may maintain information in notebooks, separate files, or different applications. Managing a large number of notes can become difficult and time-consuming.

2) Lack of Administrative User Management :

Basic note-taking methods generally do not provide an administrator module for managing registered users. A centralized system can provide an administrator with the ability to **view and delete user accounts** when necessary.

3) Limited User Authentication:

Physical notebooks and basic text files generally do not provide proper **user registration, login, and session-based access**. This can make it difficult to protect personal notes from unauthorized access.

4) Lack of Centralized Note Management :

Traditional methods may not provide a centralized platform where users can **create, view, edit, and delete** all their notes from one place. This can make note management less convenient.

3.3 HARDWARE AND SOFTWARE REQUIREMENTS:

Hardware Requirements (Minimum):

Component	Specification
Processor	Intel Core 2 Duo
RAM	4 GB RAM
Hard Disk	500 GB

Software Requirements

Operating System: Windows 7, Windows 10, etc...

Front End Tools: PHP

Back End Tools: MySQL Office

Automation Tools:

- Microsoft Office Word
- Microsoft Visio

CHAPTER 4

REQUIREMENT OF PROPOSED SYSTEM

4.0 Requirement of Proposed System

The proposed system, **TrustNote**, is a web-based personal note management system developed using PHP, MySQL, HTML and CSS. The main purpose of the system is to provide users with a simple and convenient platform for creating, storing, editing and deleting their personal notes. The system provides a secure login and registration mechanism so that users can access their own notes. Each user's notes are associated with their user account, which helps maintain privacy between different users. An administrator can manage registered users through the admin dashboard.

The proposed system requires a web browser and a local or web server environment capable of running PHP and MySQL. For development and testing, XAMPP is used to provide the Apache web server and MySQL database.

4.1 Main Modules of the System

The main modules of the TrustNote system are:

1. **User Registration Module**
Allows new users to create an account by providing the required information.
2. **User Login Module**
Allows registered users to log in using their username and password.
3. **User Dashboard Module**
Provides users with access to the main features of the system after successful login.
4. **Notes Management Module**
Allows users to create, view, edit and delete their personal notes.
5. **Admin Module**
Allows the administrator to access the admin dashboard and manage registered users.
6. **Logout Module**
Allows users and administrators to securely end their current session.

4.2 Module Description

4.2.1 User Registration

The registration module allows a new user to create an account in TrustNote. The user's password is stored using password hashing before being saved in the database. After successful registration, the user can log in to the system.

4.2.2 User Login

The login module verifies the credentials entered by the user. The system checks the username and verifies the password stored in the database. After successful authentication, a session is created for the user. Depending on the user's role, the system redirects the user either to the normal dashboard or the administrator dashboard.

4.2.3 User Dashboard

The dashboard acts as the main page for a logged-in user. It provides navigation to the notes section and other available functions. The dashboard also displays a welcome message for the logged-in user.

4.2.4 Notes Management

The notes management module is the main feature of TrustNote. Users can create new notes by entering a title and content. Existing notes can be viewed, edited and deleted. Each note is associated with the user who created it, ensuring that users can manage their own notes.

4.2.5 Admin Module

The admin module provides administrative functionality. An administrator can access the admin dashboard and view information about registered users, including their user ID, username, role and account creation date. Access to the admin dashboard is restricted to users with the administrator role.

4.2.6 Logout

The logout module terminates the user's active session. After logging out, the user must log in again to access protected areas of the system.

4.3 Features of New System

The proposed TrustNote system provides the following features:

- User registration and login.
- Password hashing for registered users.
- Session-based user authentication.
- Role-based access for users and administrators.
- Creation of personal notes.
- Viewing saved notes.
- Editing existing notes.
- Deleting notes.
- User-specific note management.
- Administrator dashboard for managing user information.
- Simple and user-friendly interface.
- Database storage using MySQL.
- Web-based access through a browser.
- Logout functionality for ending user sessions.
- Separation of users' personal notes to maintain privacy.

TESTING

Site testing is a basic component of site quality confirmation and addresses a definitive survey of determination, plan, and coding. Testing addresses a fascinating irregularity for the Site. The testing stage includes testing of the framework utilizing different test information. Planning of test information assumes a crucial part in framework testing. Subsequent to setting up the test information, the framework under review is tried utilizing those test information. In the event that testing is led effectively, it uncovers the mistakes in the Site. Also, testing exhibits that Site capabilities seem, by all accounts, to be working as per particular and execution necessities seem to have been met. Likewise information gathered as testing is led gives a decent sign of Site dependability and some sign of Site quality all in all.

The improvement of the Site frameworks includes a progression of creation exercises where valuable open doors for infusion of human questionability are gigantic. Mistakes might start to happen at very commencement of the cycle where the goals might be wrongly or defectively determined as well as in later plan and advancement stages. In light of human failure to perform and speak with flawlessness, Site improvement is trailed by a quality confirmation movement.

6.1 Test Cases

In Website engineering, the most common definition of a test case is a set of conditions or variables under which a tester will determine if a requirement or use case upon an application is partially or fully satisfied. It may take many test cases to determine that a requirement is fully satisfied. In order to fully test that all the requirements of an application are met.

Login Test

Sr. No.	Test Case	Expected Results	Actual Result
1.	Try to login with empty fields in the username and password text boxes	An error message is displayed: “Username is required Password is required”	Pass
2.	Enter invalid username and password	An error message is displayed: “Invalid username or password”	Pass
3.	Click on any feature on the website.	On clicking on any feature, check whether the user has logged in or not.	Pass

Table 6.2: Login Test Cases

Register Test

Sr. No.	Test Case	Expected Results	Actual Result
1.	Try to register with empty fields in the name, gender, contact, text boxes	An error message is displayed:	Pass
2.	Enter invalid email, password	An error message is displayed:	Pass

Table 6.3: Register Test Cases

LIMITATIONS & FUTURE EXTENSIONS

7.1 LIMITATIONS:

While developing the TrustNote (Notes Management System), there are some limitations in the current version. These limitations can be addressed in future updates to improve the functionality, security, usability, and overall user experience of the system.

(1) Basic Note Management

The current system provides basic note operations such as creating, viewing, editing, and deleting notes. Advanced features such as note categorization, tagging, pinning, and sorting are not currently included.

(2) No File or Image Attachments

The current version mainly supports text-based notes. Users cannot currently attach images, documents, PDFs, or other files to their notes.

(3) Limited Search and Organization

The system does not currently provide advanced note-search functionality, categories, labels, filters, or sorting options. Managing a large number of notes may therefore become difficult.

(4) Basic Security Features

The system provides basic user authentication and session management, but advanced security features such as OTP verification, two-factor authentication, CAPTCHA, email verification, and detailed activity logs are not currently implemented.

(5) Limited Notification Features

The current system does not provide automatic email, SMS, or browser notifications for notes, reminders, or other account-related activities.

(6) No Note Sharing or Collaboration

Users can manage their own notes, but the current system does not provide features for sharing notes with other users or collaboratively editing notes.

7.2 FUTURE EXTENSIONS

With the advancement of technology, the TrustNote (Notes Management System) can be enhanced by adding new features that improve security, organization, accessibility, and user experience. Some possible future extensions are as follows:

(1) Enhanced Security Features:

Implement advanced security measures such as OTP verification, two-factor authentication (2FA), secure password management, CAPTCHA, data encryption, and protection against SQL Injection, Cross-Site Scripting (XSS), and other security threats.

(2) Advance Notes Organization:

Introduce features such as categories, tags, labels, pinned notes, color coding, sorting, and filtering to help users organize and manage a large number of notes efficiently.

(3) Search Functionality:

Implement an advanced search system that allows users to search notes using titles, keywords, categories, tags, or note content.

(4) Reminders and Notifications :

Implement functionality of task reminders and notification that shows the time to execute the task and finish it.

(5) File and Image Attachment:

Implement functionality to attach an images and file with the notes and edit it. The image and the file stores in cloud storage such as cloundinary or google clouds etc.

CONCLUSION AND REFERENCES

8.1 CONCLUSION

It has been a great learning experience to work on the TrustNote (Notes Management System) project. The development of this project provided us with practical knowledge of web application development using PHP, MySQL, HTML, CSS, JavaScript, and related web technologies. It also improved our understanding of database management, user authentication, session management, CRUD operations, and the overall software development life cycle.

The project helped us understand the importance of developing a simple, user-friendly, reliable, and efficient note management system. Through TrustNote, users can register, log in, create notes, view their notes, edit existing notes, and delete notes that are no longer required. The administrator can log in, view registered users, and delete user accounts when necessary.

The development of TrustNote also provided valuable experience in designing web interfaces, implementing database connectivity, handling user data, managing user sessions, and developing practical features based on user requirements. It strengthened our technical skills as well as our ability to analyze requirements, design system functionality, and implement a complete web-based application.

In conclusion, TrustNote is a simple and user-friendly web application that provides an organized platform for creating and managing personal notes. It reduces the effort required to maintain notes manually and provides users with convenient access to their information. With future enhancements such as advanced search, note categories, file attachments, reminders, note sharing, cloud backup, two-factor authentication, and mobile application support, TrustNote can become a more comprehensive and feature-rich note management platform.
